

FANDOMVERSE

PORTAL FOR FANDOM WORLD

PROJECT DOCUMENTATION

TEAM	MIND UNIT
MEMBERS	ASADULLAH • HAMMAL • HASSAN • HURRAIRA

Software Requirements Specification Based Project Report

Prepared according to the supplied FandomVerse SRS and Project Report Document Template

1. Executive Summary & Problem Definition

FandomVerse is a browser-based information hub designed to bring multiple fandom interests into one engaging platform. The system covers Anime, Gaming, Movies, TV Shows, K-Pop, Comics, and Manga, while providing shared features such as search, featured articles, trailers, events, merchandise, upcoming releases, bookmarks, and a rule-based chatbot.

The project is designed as a client-side web application using HTML5, CSS3, JavaScript and structured JSON/TXT data. The SRS specifies responsive desktop, tablet and mobile support, with no server-side database or backend storage.

1.1 Project Title & Overview

Project Title	FandomVerse - Portal for Fandom World
Team	MIND UNIT
Members	ASADULLAH, HAMMAL, HASSAN, HURRAIRA
Domain	Web Innovation Unleashed / Fandom Universe
Platform	Browser-based responsive web application

1.2 Problem Statement

Fandom-related information is distributed across fan wikis, streaming platforms, social media, ticketing pages, merchandise stores, news sources and other websites. Users therefore have to move between multiple sites to find information about their favorite fandoms. FandomVerse addresses this fragmentation by presenting the required information through a unified browser experience.

1.3 Proposed Solution

The proposed solution is a visually engaging fandom information portal with category hubs, structured content cards, global search, filtering and sorting, galleries, embedded video/audio, featured articles, character profiles, events, trailers, merchandise displays, upcoming releases, bookmarks and a pre-scripted chatbot. The merchandise cart is temporary and does not perform checkout or payment.

2. System Architecture & Information Flow

The SRS defines a client-side architecture. Content is read from JSON/TXT or preconfigured links, while JavaScript manages search, filters, sorting, chatbot responses, cart totals and browser storage features. No server-side database is required.

Layer	Main Responsibility	Technology / Data
Presentation	Responsive pages, navigation, cards, galleries and visual effects	HTML5, CSS3, Bootstrap / UI framework
Application Logic	Search, filters, sorting, cart, chatbot, bookmarks and UI interactions	JavaScript / jQuery
Data	Fandom catalogs, FAQs and content metadata	JSON / TXT / hardcoded links
Browser Storage	Favorites and personal notes	Local Storage / Session Storage

2.1 Information Architecture & Sitemap

Area	Included Content
Landing Page	Seven Category Hubs
Search	Anime • Gaming • Movies • TV Shows • K-Pop • Comics • Manga
Featured Articles	Long-form news and related content
Trailers	Category and release-status filtering
Events	Category-based event listings
Merchandise	Showcase + temporary shopping cart
Upcoming Releases	Release calendar / listings
Chatbot	Floating FAQ and navigation assistant
Bookmarks	Favorites and personal notes
Contact / About	Team information, map and website details

3. Functional & System Specifications

The following matrix translates the supplied SRS into project-specific functional requirements. Generic template examples that are not part of FandomVerse have not been treated as requirements.

ID	Requirement	Implementation / Expected Behavior
FR-01	Landing & Navigation	Logo, animated heading, introduction, seven category navigation, featured content and floating chatbot.
FR-02	Category Hubs	JSON-based catalogs with cards, thumbnails, descriptions, types and tags; category-specific filtering and sorting.
FR-03	Global Search	Client-side search across categories and content types with category/type filters.
FR-04	Galleries	Image galleries in every category with lightbox or carousel interaction.
FR-05	Video & Audio	Trailers, interviews, fan content and podcasts using configured links/data.
FR-06	Featured Articles	News/article cards, detail views and related-content navigation.
FR-07	Character Profiles	At least five character profiles per category with name, image, series, biography and traits.
FR-08	Events	At least three events per category with title, date, location, description and category.
FR-09	Trailers	Dedicated trailer section with category and release-status filters.
FR-10	Merchandise	Product cards plus temporary JavaScript cart and total; no checkout/payment.
FR-11	Chatbot	Pre-scripted JSON/site knowledge base supporting FAQs, quick replies and navigation.
FR-12	Bookmarks	Local Storage favorites and Session Storage notes, with formatted export list.
FR-13	Contact / About	Team details, Google Map/GPS and website information.
FR-14	UI Utilities	Simulated visitor counter, real-time clock, hover effects, transitions, breadcrumbs and dummy auth UI.

3.1 Detailed Functional Specifications

Category Content

Each fandom hub uses structured catalog data. Cards present title, thumbnail, description, type and tags. Users can filter by type/sub-tag and sort by alphabetical order, newest, popularity or featured status.

Character Profiles

Each category is required to contain at least five character profiles. Profile information includes Name, Image, Series, Biography and Traits, with filtering by category or franchise.

Events & Releases

Each category contains at least three events. The event structure includes title, date, location, description and category. Upcoming releases are presented as a calendar/listing feature.

Merchandise

Merchandise cards show image, name, price range and description. Items can be added to a temporary JavaScript cart and totals calculated in-browser. The SRS excludes checkout, payment and actual purchases.

Chatbot Assistance

A floating chatbot provides pre-scripted answers from a JSON/site knowledge base. Users can type a question or use quick replies for FAQs, recommendations and navigation.

Bookmarks & Notes

Favorites are stored using Local Storage while personal notes use Session Storage. The system supports favorite articles, media, characters and events and can export a formatted list.

4. Hardware, Software & Development Requirements

Area	Requirement
Processor	Intel Core i5 / i7 or equivalent
Memory	8 GB RAM
Display	SVGA color display
Storage	500 GB or equivalent available storage
Input	Keyboard and mouse

4.1 Software Environment & Technical Tooling

Core technologies identified in the SRS include HTML5, CSS3, JavaScript, jQuery, Bootstrap, ReactJS/Angular, JSON/TXT and XML. Figma and AI/design tools may support design work. The chatbot may use a suitable configured interface such as Tawk.to/Tidio, while the core SRS requirement remains a pre-scripted/site-knowledge chatbot without a live backend AI dependency.

5. Non-Functional Quality Attributes

Attribute	Project Expectation
Safety & Reliability	Client-side operation should behave predictably and avoid unsafe or broken interactions.
Accessibility	Interface should be accessible and readable across supported devices and should be checked with Lighthouse.
Usability	Navigation, breadcrumbs, cards, search, filters and chatbot should be understandable to visitors.
Performance	Pages should load efficiently; images/media should be optimized and Lighthouse performance should be reviewed.
Compatibility	The application should work with current major browsers and responsive desktop/tablet/mobile layouts.
Availability	The browser application is intended to be accessible whenever the hosting/static files are available.
Capacity	Content structures should support the required categories, profiles, events, media and articles without requiring a server database.

6. Implementation & Installation Setup

The project is designed as a static/client-side web application. A local development server is recommended for consistent browser behavior and for loading local JSON/TXT resources.

- Extract the submitted project ZIP into a working folder.
- Verify the main HTML file, CSS files, JavaScript files, data resources and ReadMe/documentation are present.
- Open the project in a code editor such as Visual Studio Code.
- Run the project with a local development server such as Live Server.
- Open the generated local address in a modern browser.
- Test navigation, search/filter, galleries, chatbot, bookmarks, merchandise cart and responsive layouts.

6.1 Suggested Project Structure

index.html | css/ | js/ | data/ | assets/images/ | assets/media/ | ReadMe.doc | documentation/

7. Test Data & Validation Scenarios

Test ID	Scenario	Expected Result
TC-01	Open landing page	Logo, heading, introduction, category navigation, featured content and chatbot are visible.
TC-02	Search a known fandom item	Matching content appears from client-side structured data.
TC-03	Apply category/type filter	Only matching content remains visible.
TC-04	Sort catalog	Items reorder according to selected sorting mode.
TC-05	Open gallery item	Lightbox/carousel displays the selected image.
TC-06	Add merchandise to cart	Item is added and JavaScript total updates; no checkout is presented.

Test ID	Scenario	Expected Result
TC-07	Use chatbot quick reply	Pre-scripted answer or navigation response is displayed.
TC-08	Bookmark content	Favorite is persisted through Local Storage and can be viewed/exported.
TC-09	Responsive test	Layout adapts to desktop, tablet and mobile widths.
TC-10	Lighthouse review	Performance, accessibility and SEO issues are identified for correction.

8. AI Usage Statement & Declarations

The supplied SRS permits AI tools as development support but states that AI should not substitute for the team's understanding and implementation. The team should be able to understand, explain and justify the final project work. Any AI-assisted contribution should be acknowledged where required by the project instructions. AI-generated images are permitted by the SRS when used appropriately.

9. Deliverables Verification Checklist

- ☐ Complete project report containing problem definition, design specifications, diagrams/flowcharts/DFDs and test data.
- ☐ Mandatory installation instructions / run guide.
- ☐ Source project ZIP with required project files.
- ☐ ReadMe document.
- ☐ Mandatory demo MP4.
- ☐ Optional live project URL, if available.
- ☐ Documentation contains no source code, in accordance with the supplied SRS deliverable requirement.

Final Scope Note

This documentation follows the supplied FandomVerse SRS and the supplied Project Report Document Template. The cover page has been customized for the project team MIND UNIT and lists ASADULLAH, HAMMAL, HASSAN and HURRAIRA. The actual application design should remain aligned with the SRS requirements; a separate design file was not present among the supplied files in this task.
